

Repeated code

the same rule appears again

```
tolower(trimws(country))
```

```
tolower(trimws(background))
```

```
tolower(trimws(r_experience_level))
```

copying works, but the rule is hidden

Named function

the rule receives one name

```
clean_text <- function(x) {
```

```
  tolower(trimws(x))
```

```
}
```

one small action, one clear job

Reuse

the named rule can be called again

```
clean_text(" Nigeria ")
```

```
clean_text("KENYA")
```

```
clean_text(" South Africa ")
```

the rule is easier to reuse and inspect

Repeated logic is a signal that a rule may need a name.
